# 1 OCR introduction

## 1. Text detection: detect and label text

back side of spanish identity document

bounding boxes

## 2. Text recognition: convert image into machine-encoded text

```
{
  "street address": "avda de madrid s-n madrid madrid",
  "authority": "28391a6dk",
  "city address": "madrid madrid",
  "parents": "juan carmen",
  "mrz": "despbaa000589599999999R<<<<<<
    8001014f25010117esp<<<<<<<<<<7
    espanola<espanola<<carmen<<<<<<<"
}
```

        espanola<espanola<<carmen<<<<<<<<"
}
```

## Applications

identity document verification systems

## scanning documents for digital content management

license plate recognition for parking management

- 2 **Real-world problem solving**
- 3 Dealing with different languages
- 4 Potential value

## 2 Real-world problem solving

✗ Training a system for each language is **computationally expensive**

**N languages = N models**

## 2 Real-world problem solving

✗ Training a system for each language is **computationally expensive**

✓ **Multilingual approach:** global optimization and high maintainability in real applications →  **N languages = 1 model**

✓ **Text Spotting:** text detection and text recognition can be learned jointly with benefits

✓ **Language Predictor Network:** determine a language for text recognition module

**End-to-End framework**

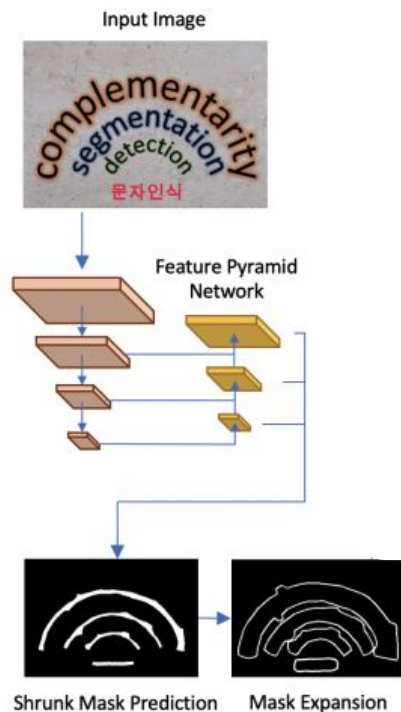

# Index

- 3 **Dealing with different languages**
- 4 Potential value

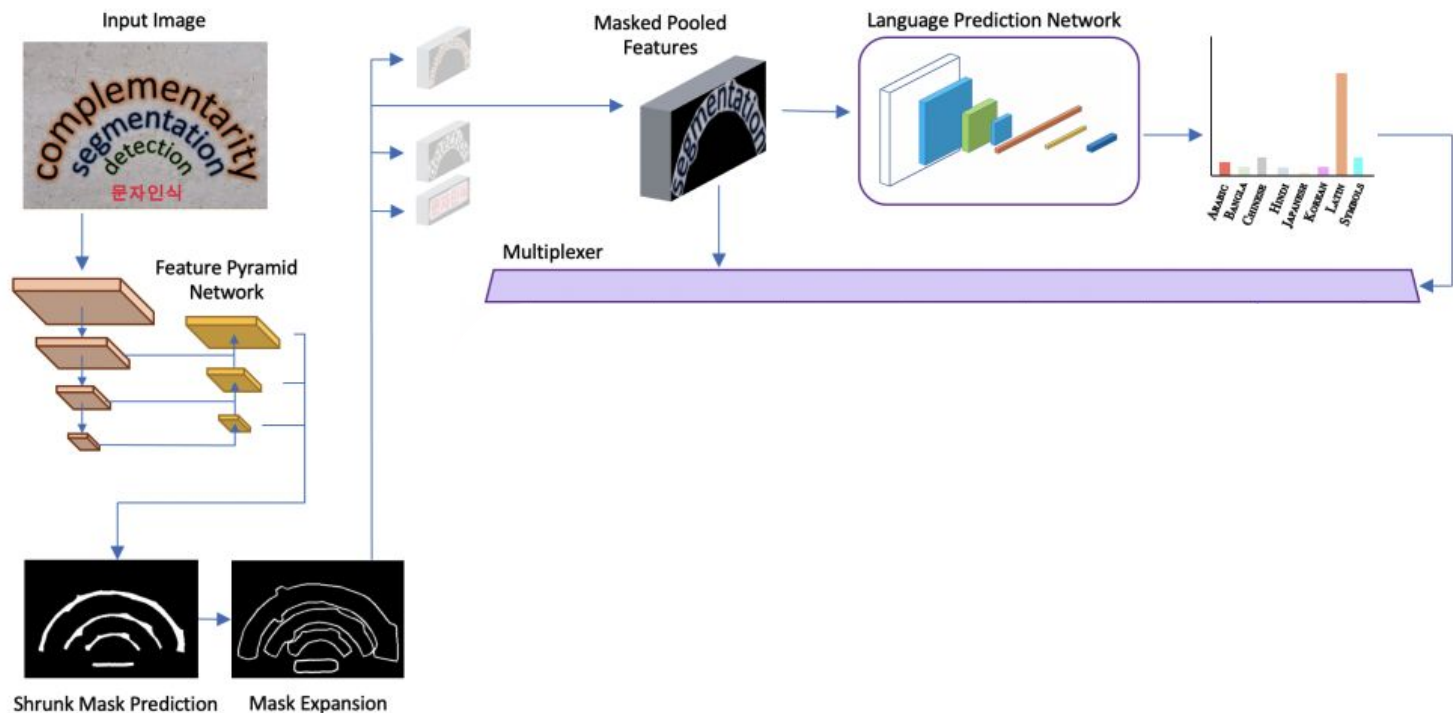

### 3 Dealing with different languages

**M3 TextSpotter:** End-to-End OCR capable of recognizing text from multiple languages co-occurring in the same scene

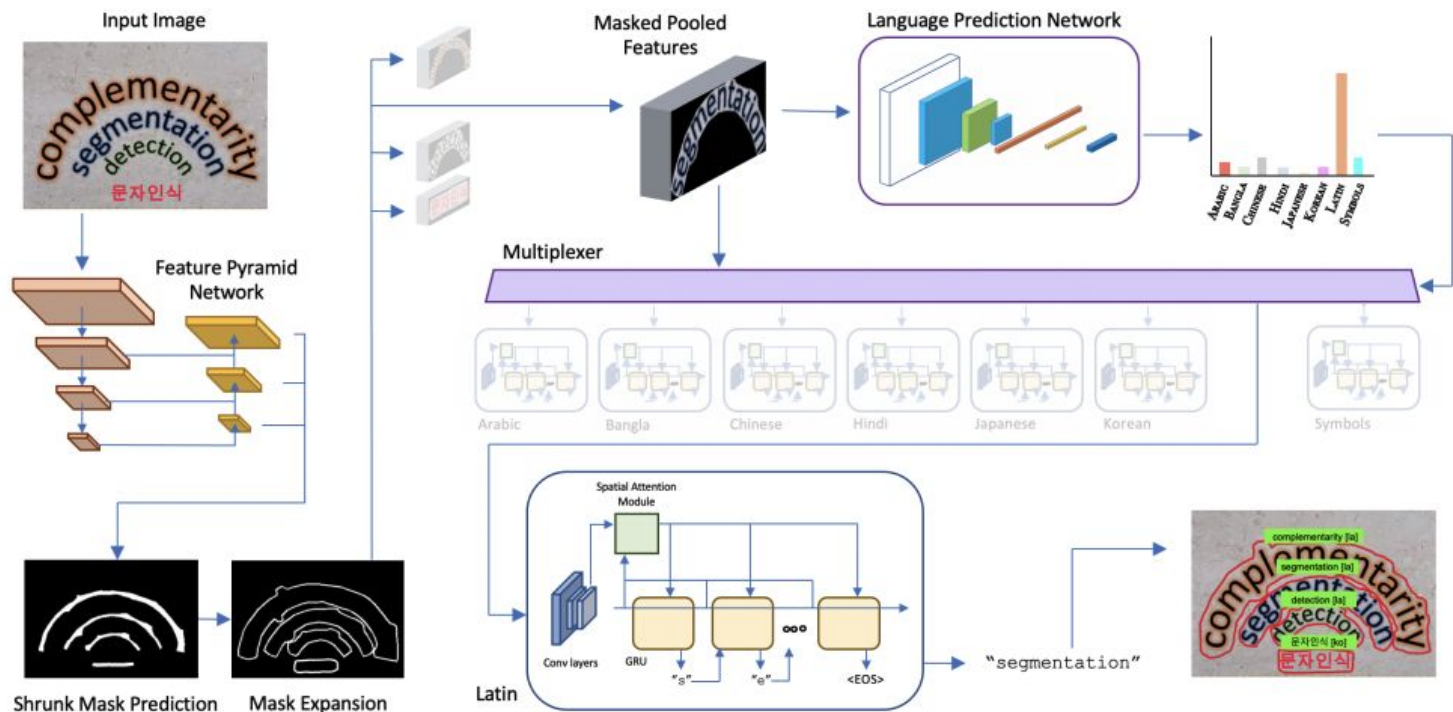

### 3 Dealing with different languages

**M3 TextSpotter:** End-to-End OCR capable of recognizing text from multiple languages co-occurring in the same scene

### 3 Dealing with different languages

**M3 TextSpotter:** End-to-End OCR capable of recognizing text from multiple languages co-occurring in the same scene

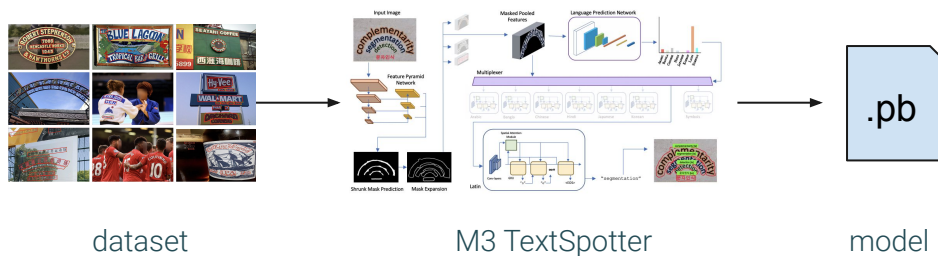

# Index

- 1 OCR introduction
- 2 Real-world problem solving
- 3 Dealing with different languages
- 4 **Potential value**

## 4 Potential value

✓ **End-to-End framework** that trains in an end-to-end manner

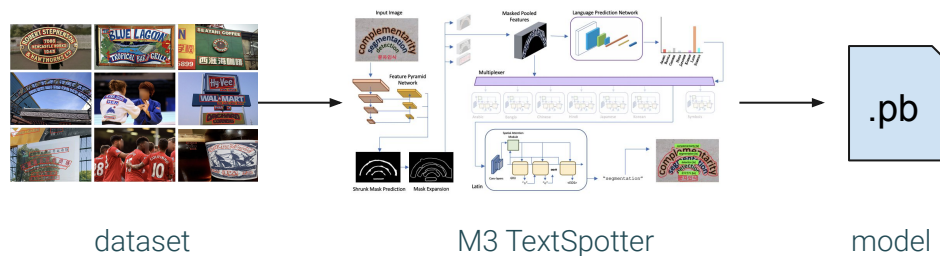

✓ **One single model** to deploy and maintain

## 4 Potential value

✓ **End-to-End framework** that trains in an end-to-end manner

✓ **One single model** to deploy and maintain

✓ **Add, remove or update the recognition module** with the languages that you want

✓ Detect and recognize text from multiple languages **within the same scene** → one image

## 4 Potential value

✓ **End-to-End framework** that trains in an end-to-end manner

✓ **One single model** to deploy and maintain

✓ **Add, remove or update the recognition module** with the languages that you want

✓ Detect and recognize text from multiple languages **within the same scene** → one image

! **Consider before starting:**

- Number of languages
- Hardware resources
- Performance goals

# Thank you!

## Questions & Answers
